Roadbook
BY HONDO GARAGE

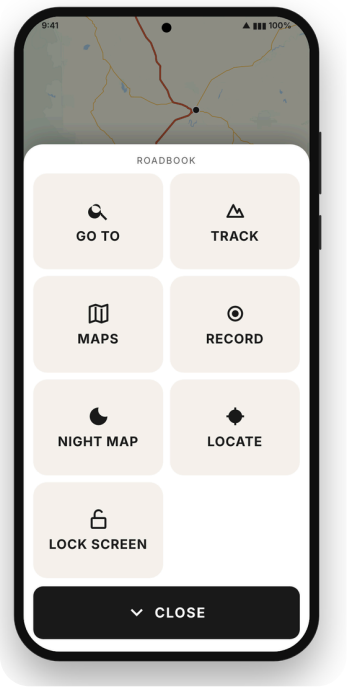

The manual, in nine screens.

Roadbook has three jobs: get you somewhere, follow a roadbook at speed, and make roadbooks. Everything lives behind one big button at the bottom of the screen — sized for a glove — which opens a sheet of giant buttons.

1 Install and get maps

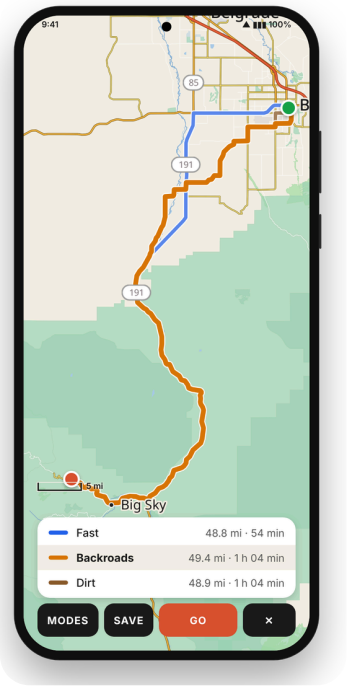

1. On the phone, open roadbook.apk, allow installs from that app, **Install**.
2. Open Roadbook, allow **Precise location**. Allow notifications if you want the recording indicator while the screen is off.
3. Tap the big `≡` button → `MAPS` → `DOWNLOAD` → pick a region, tick **Roads** and **Terrain**, `DOWNLOAD`. Half a gigabyte for a big rural state. Downloads resume if interrupted.

That is the last time the app needs a signal. Packs overlap and route across state lines.

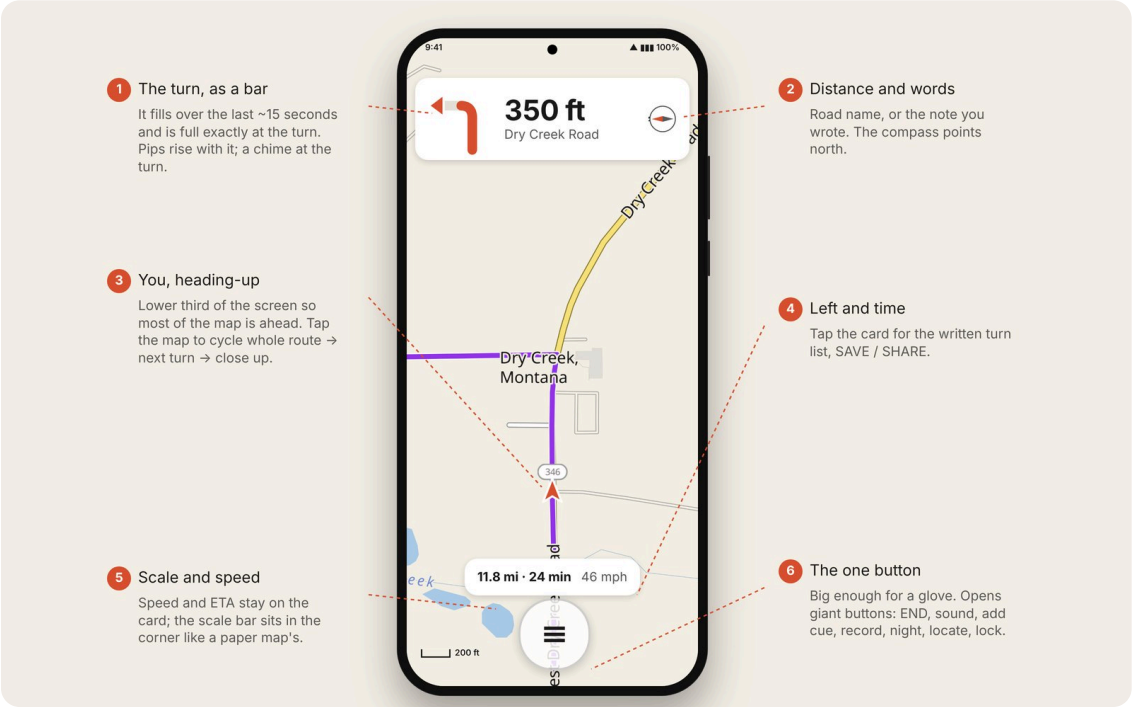

2 Go somewhere

1. **Long-press** the map → `ROUTE HERE`. Or `≡` → `GO TO` and type an address, street or town.
2. Every mode you've ticked under `MODES` is drawn at once: Fast, Towing, Backroads, Dirt, Ride, Quiet, Gravel. Tap a line or a row to choose it.
3. Long-press elsewhere → `VIA` to pull all routes through a point. `FROM` plans from somewhere other than where you are.
4. `GO`. Or `SAVE` to keep it as a roadbook (the turns go in as cues) — see step 7.

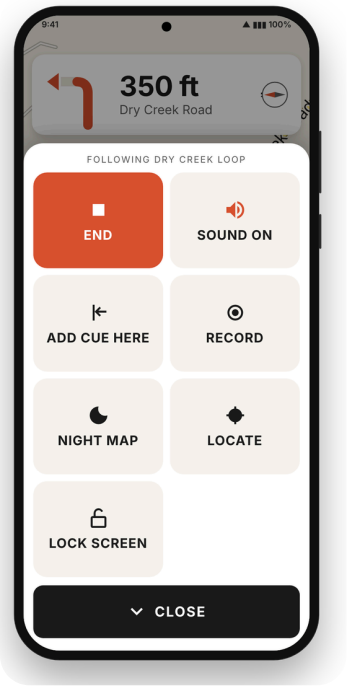

3 The screen while you ride

Heading-up, you in the lower third, the next cue on top. **Tap the map** to cycle whole route → next turn → close up; pinch to adjust, drag to look around (the crosshair resumes following).

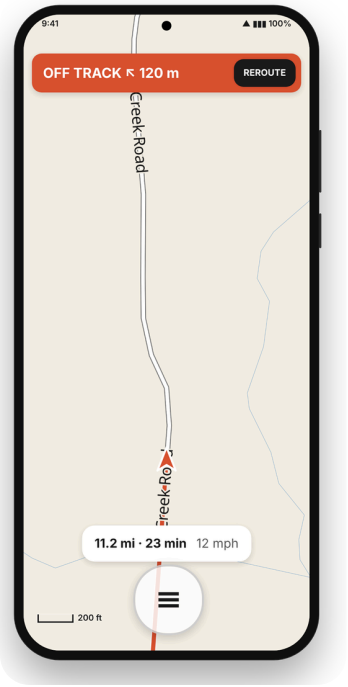

4 Sound

- ≡ → SOUND while navigating. Off by default; remembered.
- About fifteen seconds out the cue is spoken: *"Left. Onto Dry Creek Road."* Then short pips rise one octave and quicken as the bar fills. A two-note chime at the turn.
- A note is read in your words. A danger is announced, then a low buzz at the spot. A danger at the same place as a turn is one instruction: "Left. Danger. Washout." Nothing is skipped.
- The voice is built into the app. Pair a helmet headset or stereo; the cues go out as navigation audio.

5 Off the line

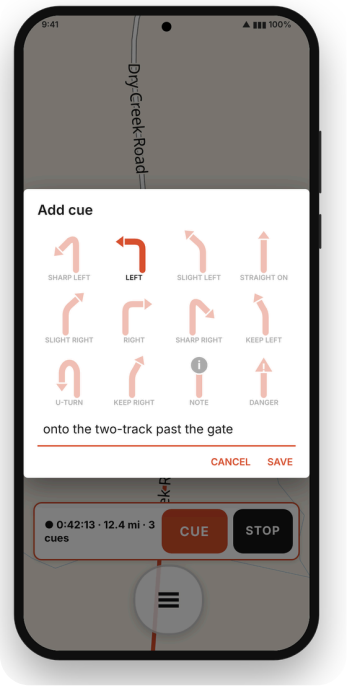

- Leave the route (gas, a look at something) and nothing changes: the banner shows the direction and distance back; one low buzz if sound is on, a short note when you're back.
- Nothing recomputes by itself. For a planned route, REROUTE asks the router from where you are. A roadbook can't be rerouted — ride back to the line.
- No fix: the card says **WAITING FOR GPS**; nothing from the GPS for 15 s: **NO GPS · 1:20** and no pips. Nothing is guessed. Poor accuracy shows a **?** after the distance.
- ≡ → END stops. Tap the bottom card for the written turn list and SAVE / SHARE.

6 Record a pre-run

1. `≡` → `RECORD`. A strip appears with big `CUE` and `STOP` buttons. Recording continues with the screen off.
2. At every turn and hazard, stop and tap `CUE`: pick the arrow, or **NOTE** / **DANGER** (severity 1–3), type what to say. One tap on an arrow is a complete cue; words are optional except for a note.
3. `STOP` → `SAVE` (into your folder) or `SHARE`. One GPX: the line plus the cues.

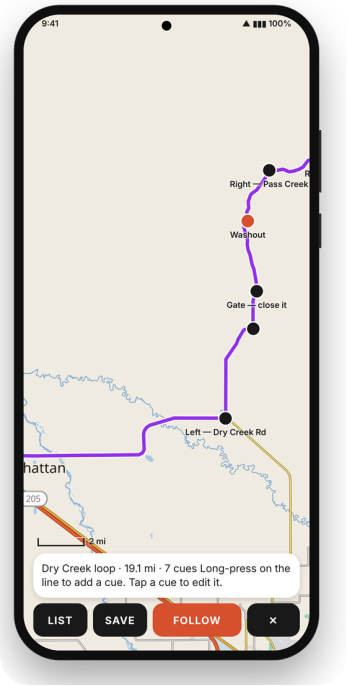

A crash or dead battery loses at most a minute; the app offers the unfinished recording next time it opens.

---

7 Edit cues on any track

1. `≡` → `TRACK` → pick a GPX → `EDIT CUES`. (`FOLLOW` rides it straight away.)
2. **Long-press on the line** to add a cue there. **Tap a cue** to change or delete it. `LIST` shows the roadbook as text.
3. `SAVE` writes over the file, or `SAVE AS`. `FOLLOW` starts riding it.
4. While following, `≡` → `ADD CUE HERE` adds a cue at your position — for the stop-and-note pass on a route you planned at the table.

8 The file

A roadbook is an ordinary GPX. Cues are waypoints whose `<type>` names them; `<desc>` carries the words. Any GPX editor can write them, and any map app still opens the file.

```
<wpt lat="46.0201" lon="-112.0000"><desc>onto the ranch road</desc><type>cue:LEFT</type></wpt>
<wpt lat="46.0302" lon="-112.0001"><desc>washout</desc><type>danger:3</type></wpt>
<wpt lat="46.0403" lon="-112.0000"><desc>water crossing</desc><type>note</type></wpt>
```

Turns: STRAIGHT, SLIGHT_LEFT, SLIGHT_RIGHT, LEFT, RIGHT, SHARP_LEFT, SHARP_RIGHT, KEEP_LEFT, KEEP_RIGHT, UTURN, ROUNDABOUT. Cues more than 150 m from the line are ignored. A track with cues is followed exactly as written — no turns are invented from its shape.

---

9 The planner, on a big screen

hondoroadbook.com/plan is the same router and the same maps, on a desk. Nothing you do there is stored unless you publish.

1. **Click the map twice**: start and finish. Pick the mode above the stats; every mode treats trails as fair game once you drag the line onto one.
2. **Drag the line** onto any road or two-track to add a stop and pull the route through it. Drag a stop to move it, click it to delete it. Stops can be added anywhere along the way; the order follows the line.
3. **Click the line** for the menu: *Add a cue* (arrow, note or danger, with words), *Inspect* (aerial imagery, what the map knows about that road, nearby Wikipedia, a web search, and one-click Google Maps / Earth / Street View at the exact spot), or *Add a stop*.
4. The cues come from the router; edit any, delete any, add your own. `reset to turns` starts over from the router's turns.
5. Layers (top right): **Terrain**, **Land ownership** (BLM surface management: public vs private, with a legend), **Aerial**, published **Roadbooks**, **Night**. The elevation profile and surface bar sit under the distance.
6. `Send to phone` shows a six-letter code. On the phone: `≡` → `TRACK` → `FETCH CODE FROM THE PLANNER`. The roadbook lands in your folder and opens. Codes last 24 hours. `Download GPX` is the same file by hand.
7. `Publish` puts it in the shared library: anyone can find it on the planner map or on the phone under `MAPS` → `BROWSE ROADBOOKS`, tap it, `FOLLOW` or `SAVE`. From the phone, any opened track has `PUBLISH TO THE LIBRARY`, with a choice to trim the ends so a ride never starts at your door. Published files keep only the line and the cues.

The link in the address bar carries your points and mode, so a plan can be shared as a link before it is ever saved.

Marks (★ on the pin panel) save a named point with a note; MAPS has EXPORT and BURN for all of them. LOCK SCREEN in the menu holds the screen the way your mount sits. Miles/km under MAPS.
